This paper is derived from the author, PhD dissertation (Silent Voices untold Perceptions of Female Students towards their own Higher Education Opportunities in Khyber). This study is aimed at exploring the attitude of parents towards contemporary women higher education. The populations for the study are the students' parents of four colleges of Peshawar, capital city of KPK, although the original study did not include the parents. Twelve Parents (mother and father) of each college were selected randomly as a sample of the study. Thus the sample consisted of 48 individuals. The findings disclosed the parents' positive perceptions toward their daughters' higher education but at the same time severe scarcity of human and physical infrastructure for girls' education was also presented in the area. The respondents confessed the domination of the paternalistic culture in KPK society that majority of parents make decisions about their daughters' future life. Although they agreed that Islam highly valued woman higher education therefore parents have to encourage women education in the province.

Key words: Khyber Pukhtunkhwah, Pakistan; attitudes; female higher education.

INTRODUCTION

According to Good (1959), attitude is the predisposition or tendency to re-act specifically towards an object, situation or value, usually accompanied by feelings and emotions. Some writers differentiate a verbal attitude from behavioral attitude; attitude cannot be directly observed but must be inferred from overt behavior, both verbal and non-verbal.

Islam gives the right of education to the female gender. The Holy Prophet Muhammad (peace be upon him) commands that acquiring knowledge is obligatory for every man and woman. Both men and women have to face accountability on the Day of Judgment on equal footing, justice demands that none of them should be deprived of knowledge (Inamullah et al., 2010).

The importance of women's role in the process of development was recognized long ago. Women have economic, political and social roles to play. Keeping in view the importance of female education, it is believed that major cause of lagging behind in general, in economic and social progress, in most of the developing countries, including Pakistan is the absence of a higher percentage of educated and technically qualified women (Aslam, 2007).

It is an economic fallacy to suppose that females are not suitable for economic platform. Women can play an important role in this field and can provide surety for prosperity (Haq, 2003). There can be no doubt that the women of Pakistan are striving to play their part in raising the status of themselves, their families and their nation. Women have already won for themselves an enviable reputation at the highest level of our national life as well as in international circles. We are confident from the spirit which the women of Pakistan have shown in such achievements as those of the “All Pakistan Women's Association” (APWA) that they can assume roles of great importance in the consolidation and development of the country if their dynamism and dedication can be nurtured and their efforts guided into those channels where they
can be of the greatest service.

Pakistan is a developing country. It is quite clear that without imparting education to the female, progress of the society will be very difficult. KPK includes tribal areas of Khyber Agency, Malakand Agency, Mohmand Agency, Kurram Agency, Orakzai Agency, North Waziristan and South Waziristan Agency. Almost 90% of the females with secondary education have very limited access to higher education. There are social, economic, geographic, and tribal Pukhtun culture, war against terrorism and other reasons for their limited access to higher education. However, importance of female education is never denied in the history. Therefore it seems appropriate to study the attitude of parents towards contemporary female education.

In the light of the above discussion, the study’s main objective is to explore the attitude of parents in different economic strata (upper, middle, lower middle and working classes) towards contemporary female higher education in KPK society. I am very positive about the implication of this research that more parents will be encouraged to send their daughters to higher education in KPK society.

**Research questions**

The research purpose of exploring parents’ attitudes has vast grounds. It was necessary to focus the study on research objectives and concentrate to get the understanding of parents in this regard. To get the comprehension of attitudes of KPK parents toward their daughters’ higher education, the study attempted to answer the following research questions.

i.) How do parents define the significance of girls’ education?

ii.) What type of role, parents wish to contribute for their daughters’ higher education?

iii.) What type of role, parents are contributing for their daughters’ higher education?

iv.) What could be possible measures to enhance parents’ role for their daughters’ higher education?

**METHODOLOGY**

This small scale research study comprised four different economic classes of Peshawar. Random sampling technique was used to select the sample from each of the following strata: upper class, higher middle, lower middle, and working class. Twelve (12) individuals (mother and father) from each class were selected randomly. During the course of the research, the law and order situation in the country, particularly in KPK, did not allow me to access more than four colleges. Secondly, I relied on those respondents who could easily be accessed. Thus, the total number of respondents’ was 48.

In previous studies conducted on the topic of parents’ behaviors, researchers used both quantitative and qualitative methods (Aslam 2007, Hussain et al., 2003; Lall 2009; Qureshi 2007; Inamullah et al., 2010; Buzdar and Ali 2011). Research purpose as well as research questions of the present study demand a deep exploration of parental attitudes towards their daughters’ higher education either positive or negative. For the collection of data, a questionnaire containing 25 items was developed using five-point Likert scale for parents, both mother and father. Questions were translated into Urdu and Pukhtu languages for the convenience of the respondents.

**Data collection**

Data were gathered by my personal visits to the sample colleges. It was observed that their attitude towards the research was very cooperative. The questionnaire was distributed to the students (as they have already been selected for my PhD sampling 2008-9). The questionnaires were taken by the students to their home that was returned to me on my next visit to the college after a week. In order to get the required information I had a glance over the questionnaire after receiving it back from the respondents.

**Analysis of data**

Data collected through above mentioned instruments was tabulated, analysed and interpreted category wise as mother and father of all economic strata. For statistical treatment chi square was not used due to a small sample size, the following formula was applied:

\[
X^2 = \frac{\sum (fo - fe)^2}{fe} \quad \text{(Fogiel, 1985)}
\]

On the basis of the analysis and interpretation of data, conclusions were drawn and recommendations were made.

**Findings and Discussion**

Education is essential for every member of the society. The process of education is from cradle to grave. The secret of survival of nations lies in education. The nation which lags behind in the field of education dies soon.
Pakistan as a developing country has a dire need for educating the individuals irrespective of the economic and gender differences for rapid progress. At this time, Pakistan is passing through a very critical situation due to extremism and terrorism and the western world blames Pakistan, especially KPK, for religious extremism. As far as Islam is concerned, it does not forbid seeking knowledge rather it obligates upon learning on every man and woman. Islam invites the people to ponder and concentrate on the creation of the universe. It develops the attitude of its followers to come forward for enhancement of knowledge.

The ultimate aim of the study was to examine the attitude of parents in different economic classes towards contemporary female higher education in KPK. The religious class always leads the nation according to the teachings of Islam but it has been blamed for negative attitude towards contemporary female higher education (Inamullah et al., 2010). The results of the study revealed 90% of parents strongly agreed for their daughters' higher education whereas 6% conditionally agreed (just as financial constraints) however, 4% disagreed. Because women form 52% of our society, closing the doors of higher education to the female gender results in the deterioration of the nation as well as the country.

The majority of the parents (70%) of different classes were of the opinion that females can play a vital role in the society as well as in the development of the country by getting higher education according to the norms and values of Islamic society. The main objective of higher education is the social and economic growth of the society and the female higher education helps a lot in this connection. Haq (2003) supported this idea by saying that the major cause of lagging behind in economic and social progress is the absence of educated and technically qualified women.

The study results found 90% parents agreed that educated women perform their duties better than other women of the society. As the educated women have lot of options before them and it is very easy for them to find a desirable solution to a problem which the other women of the society cannot do as the history of Islam records that Hazrat Aaisha (RA), the second wife of the Holy Prophet (peace be upon him) that every child is born in original purity; it is his parents who make him a Jew, Christian, or an idol worshipper (quote from Bukhari: a compilation book of Hadiths (sayings of prophet Muhammad, Peace be upon him). Naz et al. (2010) also support the significance of women's higher education, made women aware of their positive role in society and the impact of higher education made them realize the importance of improving their rights, privileges and status.

The study results found that 99% of parents strongly agreed that the establishment of women's universities would play a vital role and increased participation of women in higher education because Islamic and the traditional Pukhtun culture do not permit co-education at any level, especially, at higher level in Pakistan. Establishing of separate government schools and colleges for female students under separate female administrative authorities is of great importance. Iqbal (1997) supported this idea and noted that Pakistan had inherited one university in 1947, and, in order to provide qualified manpower, a large number of colleges, universities and professional institutes were opened. Siddiqui (2004) also supported this idea by viewing that Fatima Jinnah and Frontier women universities were established on the demand of parents who preferred to educate their daughters in female institutions. Shahzad et al. (2010) argued the view that a female university is a strong demand of KPK parents due to the prevailing targeting educational institutes in the area.

The majority of the parents (95%) viewed that highly educated girl is vitally important for grooming and upbringing of children. As the major role of education is the transfer of cultural heritage to the next generation and a highly educated girl can transfer the Islamic values to the next generation very sensibly. The Muslim families rearing of children and their character building is the responsibility of mother, so it is necessary for a woman to be educated. If the mother is bearing good thoughts and good traits, she may transfer them to her kids. The lap of mother is the first institution of a child. If she is away from ignorance and equipped with knowledge, the coming generation will get good training from this institution and in the future, this generation will produce good Muslims. Inamullah et al. (2010) further supported this idea and views that women should be given the opportunity to receive education in order to transmit this knowledge to future generations.

The study reveals that most of the parents (93%) wanted to educate the female gender up to a higher level
without any class difference for the betterment of society. Virk (2009) supported this idea by viewing that women and students from lower-income groups have much less participation in higher education which is against the principle of equity and this demands expansion of the base for higher education to give equal access to all the groups of society. The study results show that female education helps in increasing family income while taking into consideration the Islamic values and boundaries. Aslam (2007) supports this idea that economic development of Pakistan will improved by the female education that will ultimately has a positive effect on family income.

In the study, 98% of the parents agreed that educated females always abide by the social values because a highly educated woman can understand well the social norms and she can go deeper to understand what has been described as social value. Veer (2004) supports this idea by saying that the female education means alteration of gender roles and to understand exercises all human rights.

Parents showed (99%) influenced on their daughters future life and decisions. However one of the parents wrote a note in her questionnaire that ignorance is the sole cause of such attitude of parents that are preventing their daughters from higher education. According to her inadequate financial resources, preference of men’s education and investment in daughters’ dowries rather than education are the main causes of the parents’ reluctance towards daughter’s higher education.

Limitations of the study

The study had its flaws as well. The responses might be invalid and unreliable because the age difference of the respondents may influence their views. The responses might be unreliable as with the passage of time the views of the respondents may change. There are other methods of collecting and analysing the data as well but Likert scale was used only. I selected only urban samples, small sample therefore, sample sizes and urban parents could be a limitation of this study. Keeping in view the real world constraints, the study was limited only to one district; however, it was necessary to investigate the subject on a limited scale since there was no previous study in KPK on parents’ attitude to their daughters’ higher education.

Conclusions

The following conclusions were drawn from the findings of the study:

i.) The respondents viewed that higher education is the right of women and it is helpful in developing their personality and administrative capabilities and they can easily find the solution of the problem by differentiating between right and wrong along with the skillful hand in domestic jobs.

ii.) A highly educated girl is more social and obedient to her parents and her husband due to the understanding of worldly affairs and those social values, which are part and parcel of higher education. Most of the respondents viewed that the highly educated girl is more intelligent and develops mutual understanding with her husband and other members of the family effectively.

iii.) Most of the respondents viewed that it is necessary to impart higher education to females without any class difference because the highly educated girl of low income family is a big support in eradication of poverty of that family by using her faculties. The results showed that keeping girls away from higher education is injustice and the whole family would be lagging behind and the consequence is less ratio of development of the society as well as country, for both male and female are part of the same society and society develops more with the education of the both.

iv.) Separate institutes for female higher education were helpful in enhancing the number of female students for higher studies as most of the parents were against the current co-education system due to their adherence with the culture however the sample miss-interpreted, religious and culture discourses.

v.) Higher education is considered as a precious thing and parents could include it as a dowry for their daughters and it is good to equip them with higher education in the current difficult situation for safe future of their children and society. They viewed that highly educated girl maintains her respect in society by paying equal attention to the responsibilities of upbringing of children along with the jobs for economic development of the family as well as the country.

vi) Since there has not been found any strong barrier in parents’ attitudes for their daughters’ higher education, the study promotes the idea of providing a mechanism of quality and easy accessible education for girls in the areas. The steps will be helpful to create an educational environment in the areas as well as broaden the mindset of the parents.

Acknowledgement

Formally known Miss Shabana Gul Khattak, but to acknowledge my father supportive role in my academic career, I want to be known by his name, Shamaas Gul Khattak in the academic world.
